

ITSM Decision Intelligence for Proactive Service Operations

◆ The Shift

Traditional ITSM dashboards tell you what happened. ITSM Decision Intelligence reveals:

- Why it happened
- Where instability exists
- What will escalate next
- How to prevent service disruption

It moves IT from reactive incident handling to predictive, flow-optimized, risk-aware governance.

🎯 Mission

To transform IT service data into actionable intelligence that:

- Prevents major incidents
- Eliminates process waste
- Stabilizes critical infrastructure
- Elevates customer experience

✳ Vision

To build IT organizations that are:

- Predictive rather than reactive
- Flow-efficient rather than handoff-driven
- Stability-focused rather than ticket-focused
- Experience-led rather than SLA-bound

Why Traditional ITSM Reporting Isn't Helping Modern Teams

Reporting, Not Deciding

Dashboards show SLA status, ticket counts, and averages but don't explain what's really happening on the ground.

Missed Signals

Warning signals exist well in advance, yet major incidents are treated as sudden disruptions.

Scattered Data

Important signals are scattered across tools: ticketing systems, monitoring platforms, CMDBs and change records.

Firefighting Mode

Leaders struggle to understand why customers are unhappy or why teams feel overloaded despite "green" KPIs.

Reactive Metrics

Dashboards tell you what already happened, but rarely why it happened or what could happen next.

No Clear Direction

Without predictive signals, early risk patterns remain invisible until they escalate into major incidents.

From Data to Prevention

Data

Operational data from incidents, changes, assets, workloads, and customer experience

Intelligence

Connected service patterns transformed into forward-looking visibility

Decisions

Faster decisions and targeted interventions based on predictive signals

Prevention

Proactive risk reduction and strategic enablers of business continuity

Operational data becomes powerful only when converted into intelligence that drives action.

Key Benefits Unleashed

01

Early Detection of Major Incident Risk

02

30–40% Reduction in Major Incident Frequency

03

Faster Resolution Through Intelligent Workflows

04

SLA Reliability You Can Trust

05

Higher Customer Satisfaction with Smarter Service Design

06

Stronger Team Productivity Without Burnout

Our Approach

01

Discover

Understanding ITSM operational realities, Support structure, SOPs, business agreed SLAs, KPIs followed and pain areas

03

Design and Development

Data Preparation, creating reliable data models. Developing Intelligent KPI metrics, back-end coding and review

05

Automate

Build automated early-warning systems that trigger auto notification of risky tickets

02

Data and Tool Feasibility

Exploring ticket data availability, Service Now or ITSM Tool Incident/Change/CMDB tables, Power BI integration, Licenses

04

Visualize

Build interactive dashboards, decision ready and insightful visuals. Predictive flagging of Potential Major Incidents with live ticket data for quicker actions

06

Enable

Ensure teams confidently adopt intelligence-led insightful dashboard for daily operational practices

What We Deliver

Intelligence Metrics

Predictive operational metrics aligned to business priorities

Early Warning Systems

Automated risk alerts that surface emerging issues

Additional Features

Advanced visual to monitor open incidents linked to CIs with active change up to 48-hour post Change completion

Decision Dashboards

Executive-ready dashboards with forward-looking visibility

Leadership Insights

Insight frameworks that guide confident, data-backed decisions

12 New Super Intelligent KPI Metrics

Intelligence Lens	Metric Theme	What It Reveals	Decision Value
Service Quality Index – A combined performance metrics of all vital KPIs	Composite Service Health Scoring	Overall service stability	Detect degradation early
Burn Chart	Demand vs Resolution Momentum	Backlog pressure	Prevent overload
Priority Trend and Delta tickets	Urgency Pattern Shifts	Rising high- impact demand	Plan capacity early
Top CIs contributing maximum disruptions	High-Impact Asset Concentration	Most unstable components	Target remediation
Reassignment Analysis and Top traffic routes Sankey chart	Cross-Functional Workflows	Handoffs and rework	Remove bottlenecks
Support Agent Performance Scatter	Throughput vs Outcome Profiling	Contributor performance patterns	Focused coaching
CSAT vs FCR correlation analysis	Efficiency vs Experience Balance	Efficiency vs satisfaction	Improve experience
Ticket logging Channel effectiveness	Intake Pathway Impact	Channel performance impact	Smarter routing
Status Flow Sankey Chart	Lifecycle Movement Patterns	Delays and workflow loops	Optimize flow
Tickets resolved by group which transferred it earlier (Ops Wastes)	Rework & Bounce Patterns	Ownership bounce and rework	Reduce cycle time
Breach Risk	Breach & Escalation Exposure	Emerging SLA risk	Act before breach
Flagging Potential Major Incidents	Predictive Analytics	Major incident likelihood	Prevent disruption
